

Summary

Senior Data Scientist and AI Engineer building production-scale agentic AI systems, evaluation infrastructure, and AI platforms. Experienced in designing full-stack agent harnesses, domain-specific evaluation systems, retrieval infrastructure, and autonomous workflows. Focused on turning frontier AI capabilities into reliable, measurable business outcomes.

Experience

Senior Data Scientist

July 2026 - Present

Data Scientist

August 2024 - June 2026

Singapore Airlines

- Architected and built a full-stack AI evaluation platform (React, FastAPI, PostgreSQL, LangGraph) that enables domain experts to author 200+ custom criteria (code-based, baseline, and LLM-as-a-judge) without engineering support, driving 80,000+ monthly evaluations across 30+ teams.
- Designed and engineered a production agentic harness using Google ADK, with support for code execution, MCP, and graph-based memory, serving 50,000+ monthly invocations across 1,500+ agents.
- Delivered sub-second retrieval across 150,000+ monthly queries and an 80% CSAT by building an OpenSearch knowledge base with hybrid search and reranking for our public-facing chatbot.
- Developed an agentic graph workflow to automate airline customer feedback analysis, reducing time-to-action from days to minutes and saving 3,000+ analyst hours of manual analysis.
- Advised Singapore Airlines' Group CEO on frontier AI capabilities, championing the development of an agentic identity solution to seamlessly connect our tools, databases, and agents.
- Mentored 5 interns in system design and domain knowledge, enabling them to independently own and deliver 12 production features.
- Led a 17-member team to organise 5 division-wide team-building and cultural-awareness events.

Pro Bono Developer

September 2024 - Present

Total Wellness Initiative Singapore

- Prototyped a web app (Next.js, Firebase) that gamifies wellness habits for a social enterprise's pilot program, engaging 100+ monthly active users, since adopted for full-product development.

Independent AI Systems Project

March 2026 - Present

- Built a 3-node Kubernetes cluster with a Grafana observability stack, using Unsloth and ComfyUI to evaluate local inference options (e.g., Qwen, MiniMax) and benchmark quantised models.

Education

University of California, Berkeley

August 2020 - May 2024

BA in Computer Science and Linguistics (4.0 GPA, Dean's List)

Publications & Awards

Chin, C.J., Wei, R., D'Haro, L., & Banchs, R. (2017). IEEE TENCON 2017, pp. 1806-1811.

Punctuation prediction using a bidirectional recurrent neural network with part-of-speech tagging.

Singapore Airlines Open Overseas Scholarship

July 2019

One of two recipients of Singapore Airlines' premier full-ride overseas scholarship.

Skills

Software Engineering

Python, TypeScript, SQL, FastAPI, React, Next.js

Data & Retrieval

PostgreSQL, DynamoDB, OpenSearch, Redis, Qdrant, Firebase

Agentic AI

Google ADK, LangGraph, Unsloth, ComfyUI, RAG, MCP

Infrastructure

AWS, Kubernetes, Docker, OpenTelemetry, Splunk, Grafana

Spoken Languages

English (native), Chinese (bilingual), Japanese (conversational)
